

## **We help with Product Development**

Developing a new product to improve its performance often starts with competitor intelligence and analysis and using lateral thinking to apply concepts from very different technology areas. Our experts have contributed to the development of many of the chemical and polymer products used in many markets around the world today and have experience with a wide selection of manufacturing processes and raw materials. We have developed products for 3D printing, textiles, packaging and oil field chemical markets, and more.
